SUBJECT: Control Systems

## Introduction to Simulink.

■ analysing

closed loop  $\rightarrow$  it still open loop until we start to enhance it at this time we say it is closed loop.

Physical meaning of stability  $\Rightarrow$  all system are stable

stability  $\rightarrow$  it appear when there are outside parameter effect on the system.  
 $\rightarrow$  so we use stability to protect the system from affecting by this parameters.

energy is related to stability  
 we need to reduce energy losses.

System  $\rightarrow$  physical Body need to future prediction  
 ① characteristic « model, observation »  
 estimator depend on « adaptor » adapt itself and tell us the needed information.

نظام آخر مكافئ للأصل حتى يتأق

1.  $\text{adap}(A, B, C, D)$

feedback

direct transmission

2. estimator « All variable »

SUBJECT: \_\_\_\_\_

$A \rightarrow$  Eign value of  $P$  system  $\approx$  poles  
 $\rightarrow$  A matrix Can transfer into the diagonal matrix in this case.  
 $\rightarrow$  The diagonal values is equal Eign value.

ex  $\dot{X} = AX$

$SI \ X(s) - X(0) = A X(s)$

$(SI - A) X(s) = X(0)$

check linearity

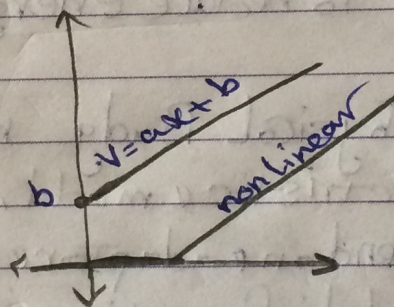

① Ohm

نُوف هدي عَقْم قَانُون أَي مَلَاتر ود في الدخْل عِب أَن يَكُون الزِيَادَة في المَخْرَج بِنَفْس المَقْدَار

2. Super position

$V = ax + b$

multi o/p  $\rightarrow$  في حالة تعرض النظام الى multi o/p  
 multi i/p  $\rightarrow$  multi i/p

Characteristic Curve

منحنى التَّحْيِيل

Stability  $\leftarrow$  زادت energy  $\leftarrow$  طاقة المدخل  
 instability  $\leftarrow$  قلت energy  $\leftarrow$  طاقة المدخل

\* The main objective of any system is to obtain eigen value.

Jordan Form  $\Rightarrow$  all the upper  $1, 0$   
 Eigen value  $\rightarrow$  diagonal  $\rightarrow$  - stable  
 at least 1 (+) unstable  
 only stable & critical  
 2's unstable.

$$\begin{pmatrix} \dot{X}_1 \\ \dot{X}_2 \end{pmatrix} = \begin{pmatrix} 0 & 1 \\ 0 & 0 \end{pmatrix} \begin{pmatrix} X_1 \\ X_2 \end{pmatrix}$$

•  $X_1 = X_2 = \text{Const}$   
 •  $X_2 = 0$  all the time  
 $\frac{dX_1}{dt} = X_2 \Rightarrow X = t$   
 نظام لا يثبت

إذا كان النظام قابل للتحكم في كل الحالات

1 - eigen value.

2 - eigen vector eigen value لكل

independency  $\rightarrow$  0

System can be invertible if parameters eigen value non zero

B

"Controllable or not controllable"

Controllable  $\Rightarrow$  i/p  $\rightarrow$  o/p  
 is the ability of the i/p to change the state of variable  
 From one point to another in a specific time.
